ABSTRACT

The **Near-Duplicate Question Finder for Q&A Platforms** is designed to identify similar questions before they are added to a database. Many Q&A platforms receive duplicate questions that increase redundancy and reduce search efficiency.The system preprocesses user queries using text normalization, tokenization, stop-word removal, and shingling. It then compares the input with existing questions using **HashMap**, **HashSet**, **Priority Queue**, and **Jaccard Similarity** to find and rank similar questions.The system displays the most relevant matches with similarity scores, helping users access existing discussions instead of creating duplicate posts. This improves information organization, reduces storage redundancy, and enhances user experience. The project demonstrates the practical use of Data Structures and Algorithms and provides an efficient, scalable solution for duplicate question detection in Q&A platforms.
